INCIDENT RESPONSE REPORT: VSFTPD BACKDOOR EXPLOITATION

1. Executive Summary

On April 12, 2026, at 10:40 UTC, Wazuh SIEM detected exploitation of a VSFTPD 2.3.4 backdoor vulnerability on server MET-SRV-01 (192.168.56.102). The attack originated from IP 192.168.56.103. The attacker successfully obtained a root shell. Immediate containment actions were executed to isolate the host and block the attacker.

2. Timeline

Time (UTC)	Event
10:29:00	Nmap scan detected vsftpd 2.3.4 vulnerability
10:40:00	Metasploit exploit successful, root shell obtained
10:41:00	Wazuh alert triggered (MITRE T1190)
10:45:00	Attacker IP 192.168.56.103 blocked via CrowdSec
10:50:00	Affected VM network adapter disabled for isolation
11:00:00	Forensic memory dump acquisition started
11:30:00	Incident report drafted and case closed

3. Impact Analysis

- Single non-production test server compromised.
- No lateral movement or data exfiltration detected.
- No customer or production systems affected.

4. Remediation Steps

- Disabled vsftpd service and removed vulnerable package.
- Applied CrowdSec block for attacker IP.
- Isolated VM from network for forensic imaging.

5. Recommendations

- Upgrade all legacy services or decommission obsolete software.
- Implement network segmentation for lab environments.
- Conduct regular vulnerability scans on all assets.
