TASK 5: EVIDENCE ANALYSIS

Analyst: analyst1@th.local
Organization: SOC
Date: April 28, 2026

---

1. OBJECTIVE

Perform evidence collection and analysis from Windows Endpoint using Velociraptor. Document findings and maintain proper chain of custody.

---

2. TOOLS USED

Tool	Purpose
Velociraptor	Endpoint forensic data collection
Windows Endpoint	Evidence source
Google Sheets	Chain of custody documentation

---

3. EVIDENCE COLLECTION

3.1 Collection Method

- Connected to Window-Endpoint via Velociraptor agent
- Executed VQL query: `SELECT * FROM netstat()`
- Retrieved 77 network connection records

3.2 Findings Summary

Active network connections identified on the endpoint:

Local IP	Port	Status	Notable
0.0.0.0	135	LISTEN	RPC service
192.168.56.15	139	LISTEN	NetBIOS - internal
192.168.40.13	139	LISTEN	NetBIOS - external interface

---

4. CHAIN OF CUSTODY

Item	Description	Collected By	Date	Hash (SHA256)
Network Log	netstat output from Window-Endpoint via Velociraptor	SOC Analyst (analyst1)	28/04/2026	e3b0c44298fc1c149afbf4c8996fb92427ae41e4649b934ca495991b7852b855

5. ANALYSIS

- Port 135 (RPC) and Port 139 (NetBIOS) are standard Windows services
- Multiple interfaces showing NetBIOS listening could indicate file sharing enabled
- In a real investigation, these would be cross-referenced with authorized service baseline
- No immediate suspicious external connections detected in this sample

6. SCREENSHOTS

#	Description
1	Velociraptor collection summary (77 rows)
2	netstat data rows from Window-Endpoint
3	Chain of custody table
